Problem Statement

This example is adapted from a real production application, but with details disguised to protect confidentiality.

You are a famous researcher in the City of Peacetopia. The people of Peacetopia have a common characteristic: they are afraid of birds. To save them, you have **to build an algorithm that will detect any bird flying over Peacetopia** and alert the population.

The City Council gives you a dataset of 10,000,000 images of the sky above Peacetopia, taken from the city's security cameras. They are labelled:

- y = 0: There is no bird on the image
- y = 1: There is a bird on the image

Your goal is to build an algorithm able to classify new images taken by security cameras from Peacetopia.

Bird recognition in the city of Peacetopia (case study)

Quiz, 15 neares to make:

15/15 points (100%)

- What is the evaluation metric?
- How do you structure your data into train/dev/test sets?

Metric of success

The City Council tells you that they want an algorithm that

- 1. Has high accuracy
- 2. Runs quickly and takes only a short time to classify a new image.
- 3. Can fit in a small amount of memory, so that it can run in a small processor that the city will attach to many different security cameras.

<u>Note</u>: Having three evaluation metrics makes it harder for you to quickly choose between two different algorithms, and will slow down the speed with which your team can iterate. True/False?

True			
Correct			
False			

1/1 point

2.

After further discussions, the city narrows down its criteria to:

- "We need an algorithm that can let us know a bird is flying over Peacetopia as accurately as possible."
- "We want the trained model to take no more than 10sec to classify a new image."
- "We want the model to fit in 10MB of memory."

If you had the three following models, which one would you choose?

Test Accuracy	Runtime	Memory size
97%	1 sec	ЗМВ
Test Accuracy	Runtime	Memory size
99%	13 sec	9MB
Test Accuracy	Runtime	Memory size

Bird reco	ognition in the city of Pe	ac ^{3 sec} pia (case stu	dy ²) ^{MB} 15/15 points	s (100%)
0	Test Accuracy	Runtime	Memory size	
	98%	9 sec	9MB	

Correct

Correct! As soon as the runtime is less than 10 seconds you're good. So, you may simply maximize the test accuracy after you made sure the runtime is <10sec.

1/1 point

3.

Based on the city's requests, which of the following would you say is true?

Accuracy is an optimizing metric; running time and memory size are a satisficing metrics.

Correct

Accuracy is a satisficing metric; running time and memory size are an optimizing metric.
Accuracy, running time and memory size are all optimizing metrics because you want to do well on all three.
Accuracy, running time and memory size are all satisficing metrics because you have to do sufficiently well on all three for your system to be acceptable.

Structuring your data

Before implementing your algorithm, you need to split your data into train/dev/test sets. Which of these do you think is the best choice?

Train	Dev	Test
6,000,000	1,000,000	3,000,000

Train	Dev	Test
3,333,334	3,333,333	3,333,333

9. Which	of the following statements do you agree with?
0	A learning algorithm's performance can be better than human-level performance but it can never be better than Bayes error.
Corre	ect
	A learning algorithm's performance can never be better than human-level performance but it can be better than Bayes error.
	A learning algorithm's performance can never be better than human-level performance nor better than Bayes error.
	A learning algorithm's performance can be better than human-level performance and better than Bayes error.

Bird cacagnition in the ditytote back at options (100%)

Quiz, 15 entertion ance, so you define that as "human-level performance." After working further on your algorithm, you end up with the following:

Human-level performance	0.1%
Training set error	2.0%
Dev set error	2.1%

Based on the evidence you have, which two of the following four options seem the most promising to try? (Check two options.)
Try increasing regularization.
Un-selected is correct
Try decreasing regularization.
Correct
Train a bigger model to try to do better on the training set.
Correct
Get a bigger training set to reduce variance.
Un-selected is correct

1/1 point

You also evaluate your model on the test set, and find the following:

Human-level performance	0.1%
Training set error	2.0%
Dev set error	2.1%
Test set error	7.0%

What does this mean? (Check the two best options.)

You should try to get a bigger dev	set

13.

It turns out Peacetopia has hired one of your competitors to build a system as well. Your system and your competitor both deliver systems with about the same running time and memory size. However, your system has higher accuracy! However, when Peacetopia tries out your and your competitor's systems, they conclude they actually like your competitor's system better, because even though you have higher overall accuracy, you have more false negatives (failing to raise an alarm when a bird is in the air). What should you do?

	Look at all the models you've developed during the development process and find the one with the lowest false negative error rate.	
	Ask your team to take into account both accuracy and false negative rate during development.	
0	Rethink the appropriate metric for this task, and ask your team to tune to the new metric.	
Correct		
	Pick false negative rate as the new metric, and use this new metric to drive all further development.	

1/1 point

14

You've handily beaten your competitor, and your system is now deployed in Peacetopia and is protecting Birdhecognition into Peacetopia and is protecting Birdhecognition in Peacetopia and Indiana in Peacetopia and Ind

You have only 1,000 images of the new species of bird. The city expects a better system from you within the next 3 months. Which of these should you do first?

Use the data you have to define a new evaluation metric (using a new dev/test set) taking into account the new species, and use that to drive further progress for your team.

Correct

Put the 1,000 images into the training set so as to try to do better on these birds.
Try data augmentation/data synthesis to get more images of the new type of bird.

Add the 1,000 images into your dataset and reshuffle into a new train/dev/test split.

15.

The City Council thinks that having more Cats in the city would help scare off birds. They are so happy with your work on the Bird detector that they also hire you to build a Cat detector. (Wow Cat detectors are just incredibly useful aren't they.) Because of years of working on Cat detectors, you have such a huge dataset of 100,000,000 cat images that training on this data takes about two weeks. Which of the statements do you agree with? (Check all that agree.)

Bird rec	Having built a good Bird detector, you should be able to take the same model and Ogpitioaniarthe city pt Peacetopia (4,38 ආණ්ඩර්හ) heed to iterate. ions					
Un-s	Un-selected is correct					
	Buying faster computers could speed up your teams' iteration speed and thus your team's productivity.					
Corre	ect					
Corre	If 100,000,000 examples is enough to build a good enough Cat detector, you might be better of training with just 10,000,000 examples to gain a \approx 10x improvement in how quickly you can run experiments, even if each model performs a bit worse because it's trained on less data.					
Corre	Needing two weeks to train will limit the speed at which you can iterate.
